

Functional Roles of Migratory Waterbirds

Josh Nightingale

Universidade Federale do Rio Grande do Sul

& Erasmus Mundus
International Master in Applied Ecology

Questions

- Community assembly in same environments from different species pools
 - Is there evidence of consistency?
 - i.e., environmental determinism

Questions

- Functional equivalence of summer and winter migrants?
- Functional roles of migratory vs resident species?
- Differences between habitats in functions supported?

Approach

- Functional roles of migratory vs resident species?
 - PCoA scores from Gower distance matrix
 - Compare between migrants and residents
 - Difference between pairs of migrants vs. random pairs

Approach

- Functional equivalence of summer and winter migrants?
 - Hierarchical clustering of species and trait data (using Gower distance)
 - Variance partitioning of β -variation

Predictions

- Functional equivalence of summer and winter migrants?
 - Hierarchical clustering of species and trait data (using Gower distance)
 - Species data clusters within seasons
 - Functional data within habitats
 - Variance partitioning of β -variation
 - Species data varies more by seasons
 - Functional data varies more by habitat

Species data

- By season

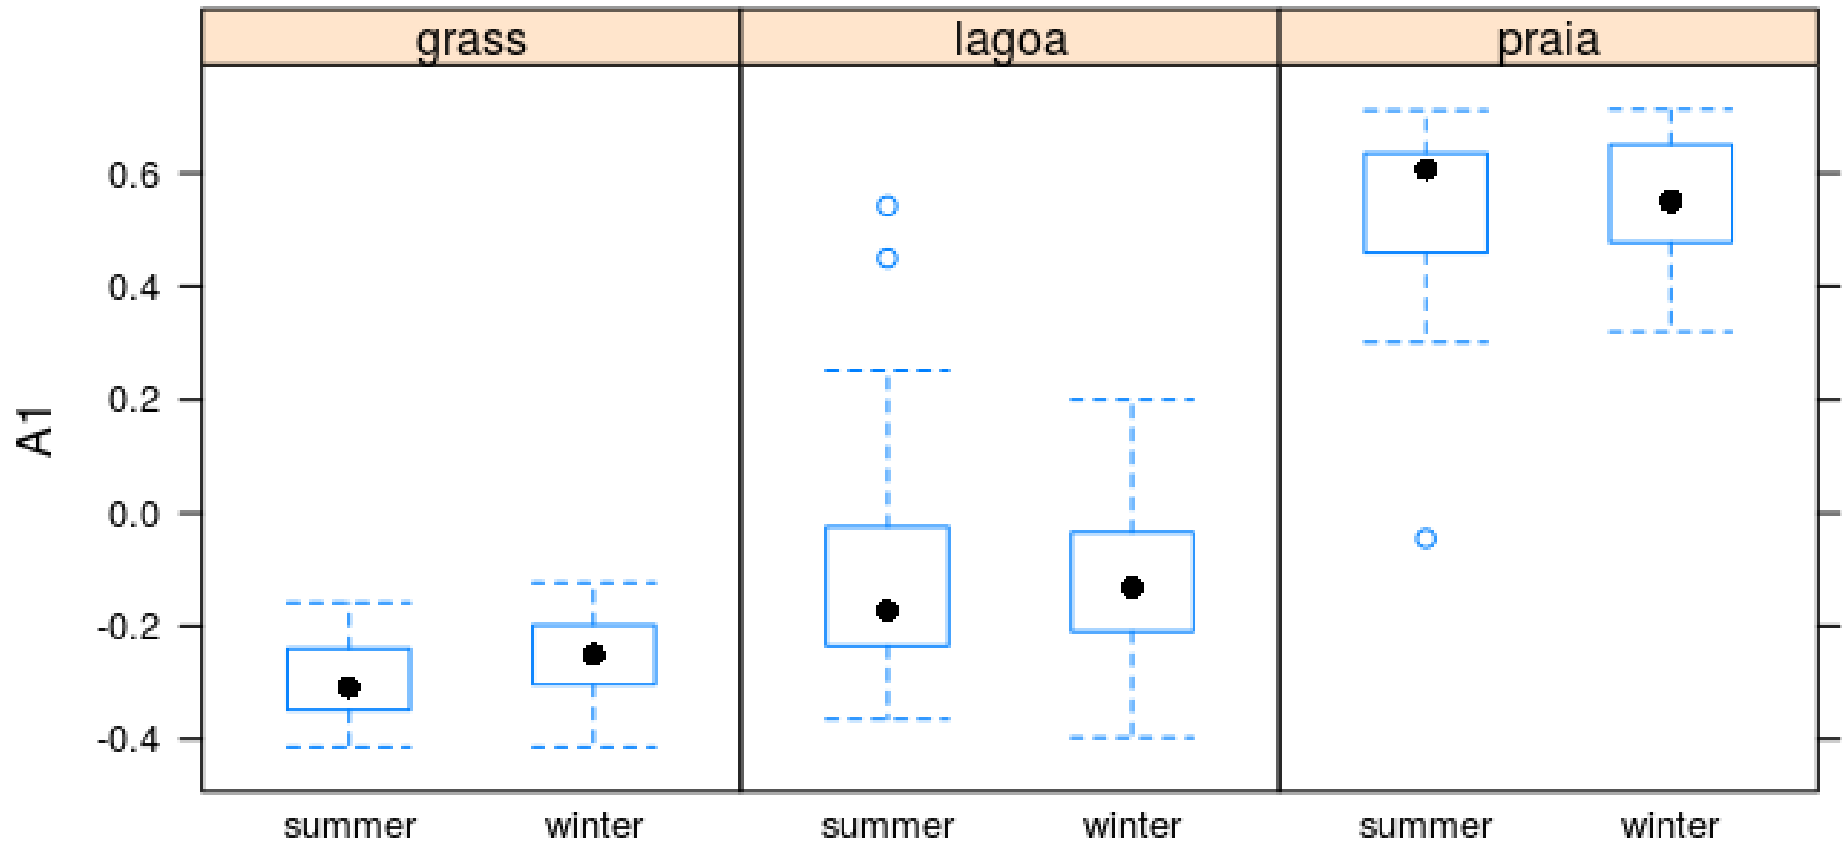

Species data

- By habitat

Species data

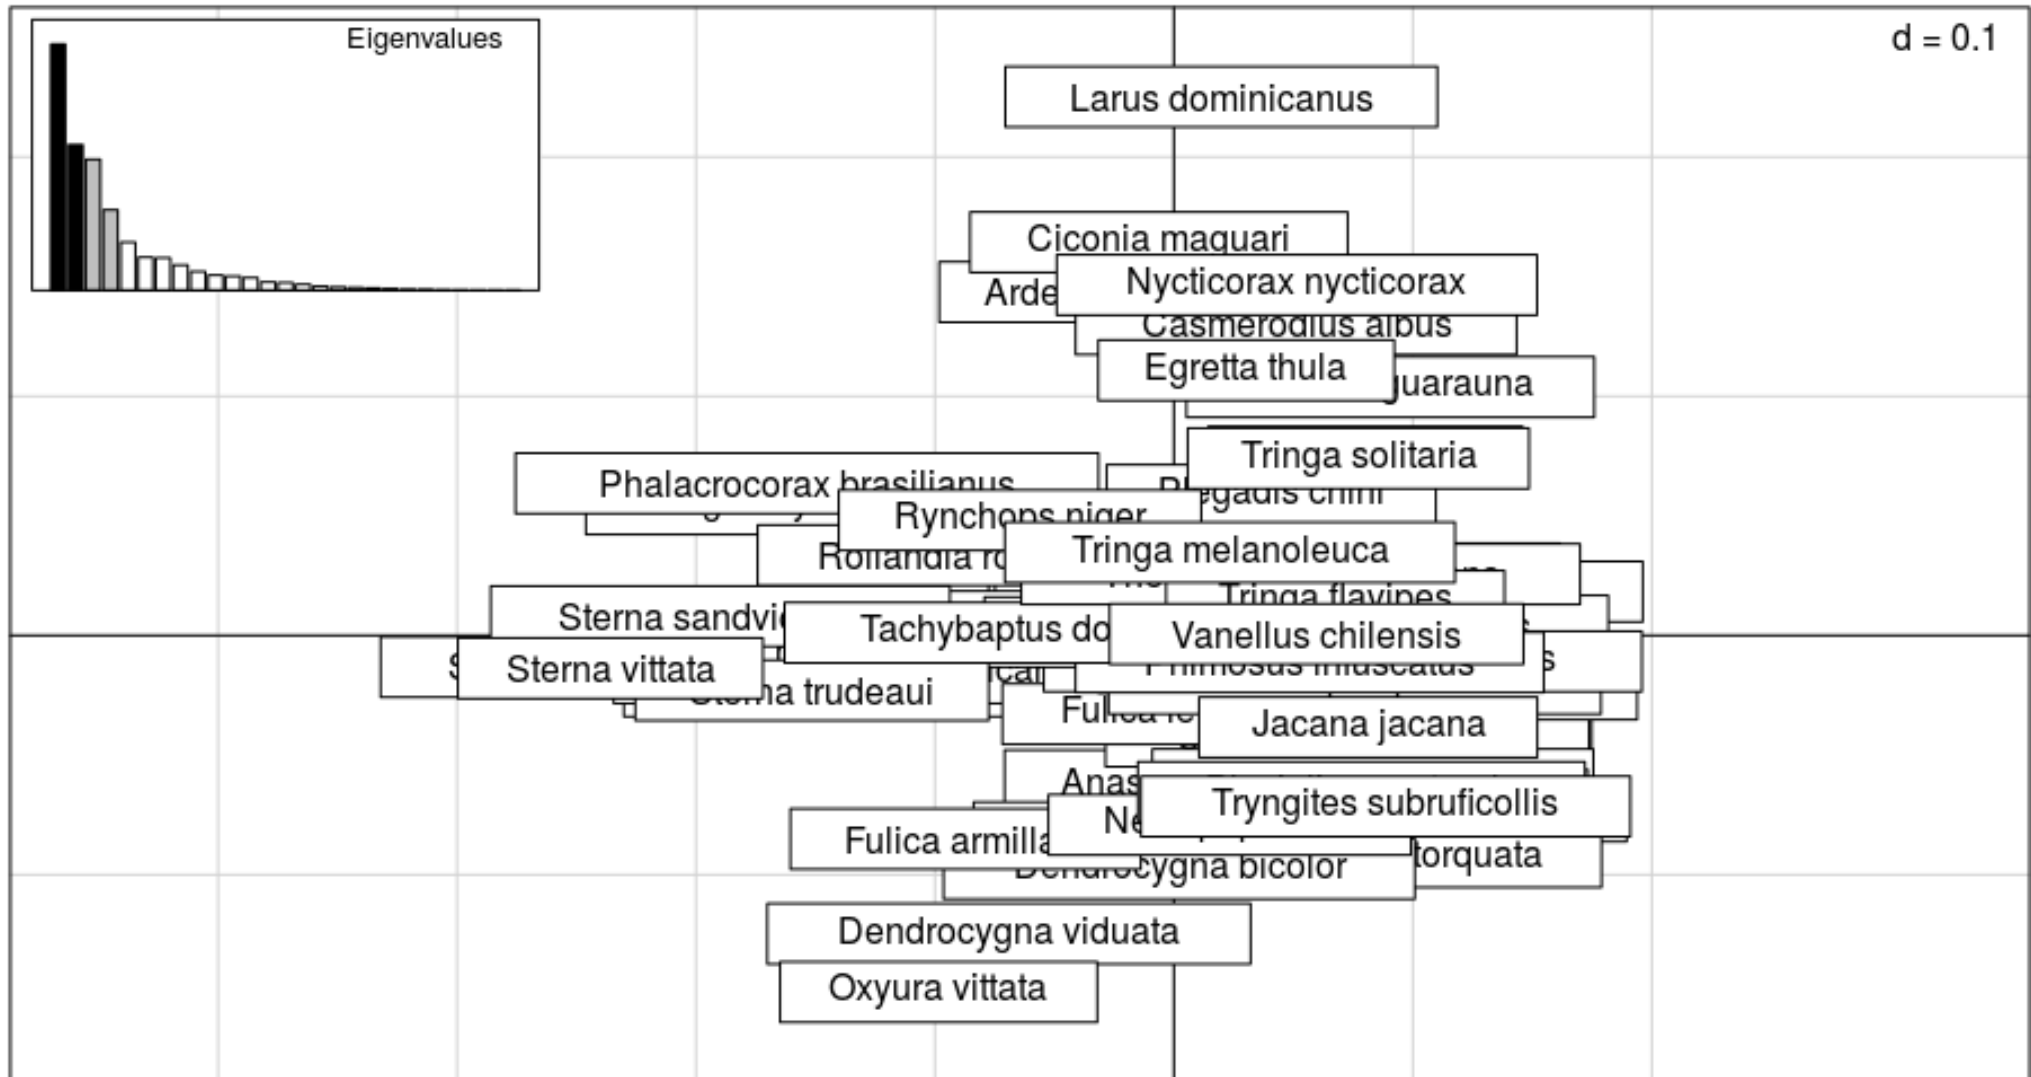

Presence/absence

Species data

Log-transformed

Functional variation

Functional data

- By season

Functional data

- By habitat

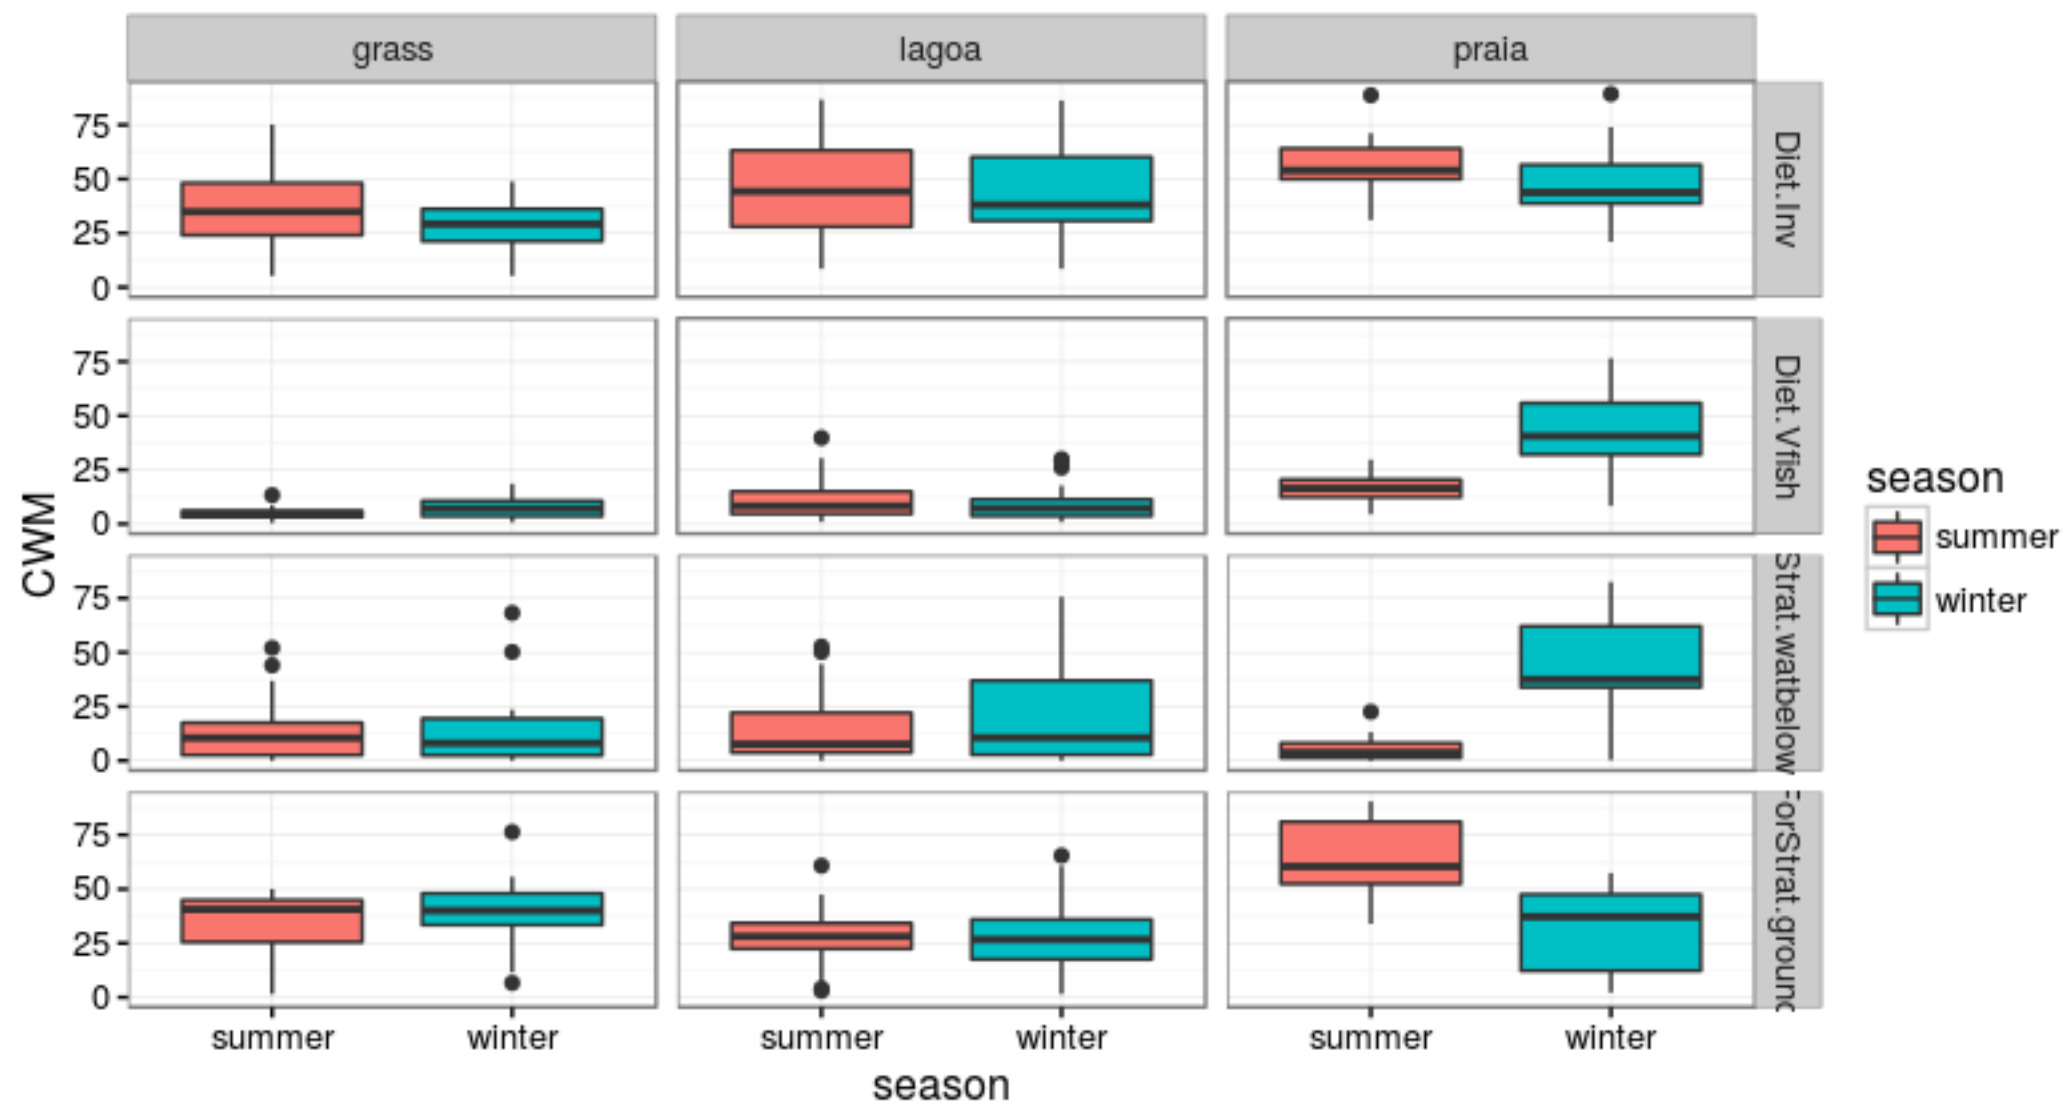

Functional data

Approach

- Differences between habitats in functions supported?
 - Comparison of CWMs

“Conclusions”

- Signals not very clear visually
 - Need an analytical approach
- Species clearly cluster within habitats more than seasons
 - Migrants a small % of community
- Some evidence of seasonal functional changes

TODO

- Normalize species data within sites?
 - Or use presence/absence?
- Analyse functional groups of species separately
- Seasonality of resident species?
- Temporal trends? (2005-2016)
